

XM100W

The XM-100 polycrystalline panel is an excellent choice for dependable off-grid power generation.

The panel features hail-proof tempered glass and closely-packed polycrystalline cells, sealed into a robust aluminium frame. The compact junction box – unlike in many solar panels – doesn't protrude beyond the frame, so installation can be simple and neat.

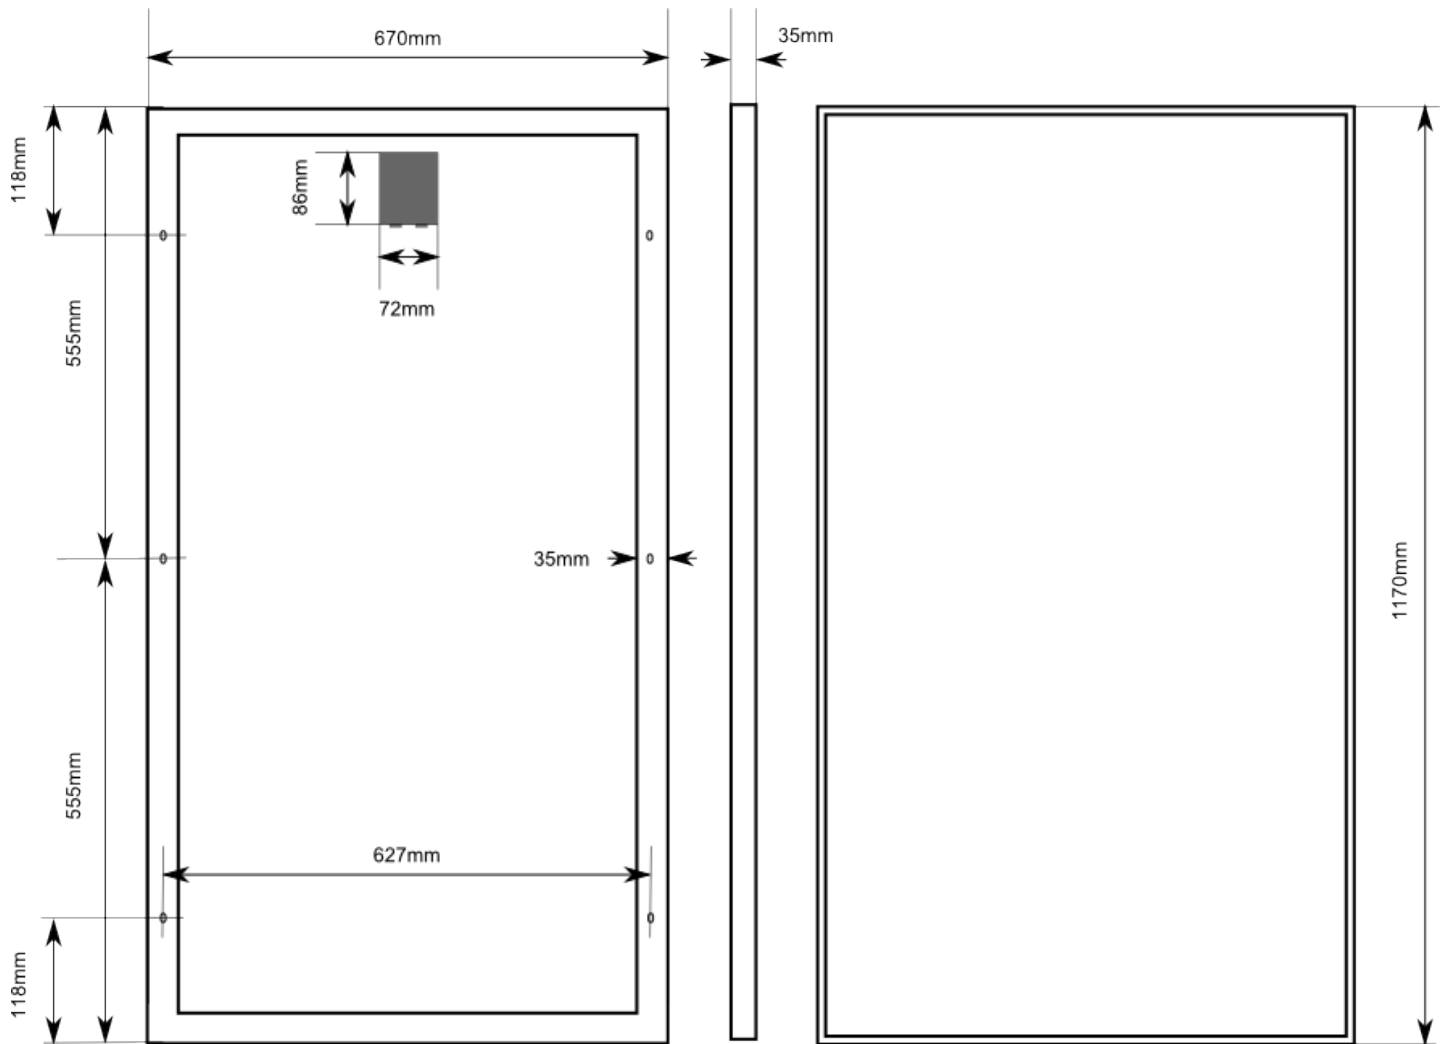

This panel is ideally suited to off-grid leisure applications such as narrowboats and motorhomes. It is also a very cost-effective choice for outbuildings away from the national grid, and for power systems to run automated monitoring equipment such as CCTV cameras.
